ABSTRACT:

The present study examined the relationship of depression with family environment among adolescents in Chandigarh. For the collection of data Beck Depression Inventory-II and Family Environment Scale were used. For the analysis of data statistical techniques like t-test, Pearson product moment correlation and stepwise multiple regression were used.

Abstract Report: The Title Accurately Said The Study was About.

INTRODUCTION:

Depression is a major cause of disability across the regions and it causes fatigue, suicide, decreased ability to do work and attend school (Institute for Health Metrics and Evaluation, 2013). Depression disrupts a person's thinking processes, emotional reactions and day-by-day behaviours (Williams, 1984; Farby, 1980).

Introduction Report: This Article Include Full Introduction, Methods, Results & Introduction Section.

METHODS & MATERIALS:

For the present study, a sample of 300 adolescents (150 boys and 150 girls studying in XI class pursuing science, arts and commerce streams) was drawn from Government Model Senior Secondary Schools of Chandigarh by employing stratified random sampling technique. There was no clinical history of adolescents.

Methods & Materials Report: Tables/Boxes/Diagram & Images are Used to Explain Specific Points or Background Information. Figures That The Plotted Parameters are Clearly Mentioned.

RESULT:

Table 1 represents the comparison of boys and girls on the variables of depression and dimensions of family environment. From the table 1 it was found that boys and girls did not differ significantly on depression (t = 0.96) however girls (M = 18.23) exhibited somewhat more depression as compared to boys (M = 17.03). Thus, the null hypothesis, “There is no significant gender difference on the variable of depression” stands accepted.

Result Report: Figures are Imported to Provide Explanation for Background Information. Conclusion of This Paper Clearly Supported Results.

DISCUSSION:

The results of present study demonstrated that depression was significantly and negatively correlated with cohesion, expressiveness, independence and recreational orientation dimensions of family environment. Also, it was observed that expressiveness, cohesion and independence were the significant predictors of depression which demonstrated that high expressiveness, cohesion and independence in the families leads to lower level of depression.

Discussion Report: The Text is Rounded off with a Conclusion that Discusses the Implication of The Findings & Ideas Discussed & Their Impact on Future Research Direction.
