Indian Streams Research Journal is a multidisciplinary research journal, published monthly in English, Hindi & Marathi Language. All research papers submitted to the journal will be double - blind peer reviewed referred by members of the editorial board. Readers will include investigator in universities, research institutes government and industry with research interest in the general subjects.

ICHTHYOFAUNAL DIVERSITY OF KUSHESHWAR ASTHAN CHAURS, DARBHANGA DISTRICT OF BIHAR

Jay Prakash Lal Das and Soma Rani Kolay

Dept. of Zoology, Millat College, Darbhanga, L.N.M University, Darbhanga, Bihar, INDIA.

Abstract:- The present study on ichthyofaunal biodiversity of a Kusheshwar sthan chaurs was carried out from June 2013 to May 2014, for a period of one year. Fishes are very important from the biodiversity point of view. Therefore, during the present investigation, fishes were collected and identified. The aim of this study was to reveal the faunistic diversity of fish species in this lake. The various fishes collected from this lake are found to be very common in respect of other lentic and lotic water bodies of Darbhanga and are represented by 9 orders, 18 families, 27 genera and 50 species. The family Cyprinidae was observed as the most abundant of all, consisting of 50 species are recorded, genus *Puntius* was the dominant, followed by carps, Murraels, and cat fishes.

Keywords: Ichthyofauna, biodiversity, Kusheshwar sthan, Bihar. Jhang.

INTRODUCTION

Kusheshwar sthan is one of the best wetland available in the country and has a traditional wintering refuge of migratory birds besides resident species. It is a valuable repository of both plant & animal biodiversity. Large scale of fishing activities occurs in these water bodies now due to wild life protection act bird trapping is decline. Kusheshwar sthan (26°10'N 86°02'E) is the 2nd largest protected area for birds in Bihar known since pre independence for its large diverse congregation of birds. This permanent water body is located 65 km from Darbhanga town (MSL 49m) in Biraul subdivision including the Block Biraul Ghanshyampur. The low lying area of these blocks are dotted with perennial ponds and lakes during flood the water from nearby river fills the lake and water level of the lake rises during the monsoon more than 10,000 ha become inundated as this lakes join with Simri jheel & Kabar taal (an IBA) (Yadava 1995) rain and over flow of The rivers Kamla, Bagmati, Kareh are the main source of water for these lakes. Large no of local people have been dependent on this wetland for fishing and for some aquatic crops such as Makhana (*Euryale ferox*). Now the lake is occupied by fisherman and agriculturist although the trapping of birds is prohibited. Now many local people still depends on it for their survival catching birds and selling them live. Kusheshwar sthan was known as the winter capital of migratory birds. It is one of the best water fowl habitats in India. Kusheshwar sthan is famous for its shiv temple and is an important site for religious tourism. The Kusheshwar sthan wetland are famous for the fresh water fish such as for food fish and ornamental fish most of the wetland pond are covered with water hyacinth, *Eichhornia crassipes* the local fisherman bind them together in small pocket for fishing by a special technique known as jhang fishing. jhang is artificial assemblage of wild fish after constructing of jhang left over for 10-20 days to aggregate fish after that press net (chatty jaal) are used for catching of wild fish. The North Bihar and especially the Darbhanga district has large inland fisheries and adequate fresh water resources in the form of rivers and their tributaries, Ponds, tanks, wetlands (Chauras), and canals. This is one of the prime aquatic resources of this district supporting a rich aquatic biodiversity. The main source of water is rain in the catchment area. Fishes are one of the best indicators of quality of any aquatic ecosystem and occupy a remarkable position from socio economic point of view. A large population of this area and the district is suffering from nutritional hazards mainly from malnutrition and protein deficiency. The fishes are very rich source of protein as well as vitamins and other minerals. This Chauras is used for capture of fishes by local fishermen communities.

SIZE OF KUSHESHWARSTHAN

The Kusheshwar sthan chaurs varies ranges from 50 to 700 ha the depth of these water bodies ranges from 1.0 to 3

Jay Prakash Lal Das and Soma Rani Kolay, "ICHTHYOFAUNAL DIVERSITY OF KUSHESHWAR ASTHAN CHAURS, DARBHANGA DISTRICT OF BIHAR" Indian Streams Research Journal | Volume 4 | Issue 5 | June 2014 | Online & Print

meter water spread area at the rainy season is about more than 10,000ha During winter season (Months) the chauras is around Kusheshwar sthan provide lucarative capture fishery such as W.attu, Eel, Cuchia, carp, Murrels, food fish and ornamental fish as beside capture a no of resident migratory bird. Fishing and bird trapping are rampant in the area. The primary source of water in chauras Kamla Bagmati and Kareh.

FISHAND FISHERIES

The Chauras of Kusheshwar sthan have ichthyofaunal diversity refers to variety of species Labeo rohita, Labeo calbasu, Puntius ticto, Puntius conchoni, Puntius Sarana, Esomus danricus, Chela laubuca, Cirrihinus mrigala, Cirrihinus reba, Catla catla, Oxygaster bacaila, Amblypharyngodon mola, Botia Dario, Nemacheilus botia, leptocephalichthys guntea, Somileptes gongota, Bagarius bagarius, Silonia silondia, Wallago attu, Ompok bimaculatus, Aorichthys seenghala, Mystus vittatus, Ailia coila, Heteropneustes fossilis, Clarias batrachus, Channa punctatus, Channa striatus, Channa gachua, Channa marulius, Macrognathus aculeatus, Mastacembelus pancalus, Mastacembelus armatus, Anabas testudineus, Colisa fasciatus, Chanda nama, Chanda ranga, Colisa chunna, Nandus nandus, Glossogobius giuris, Gonialosa manmina, Gudusia chapra, Setipinna phasa, Notopterus notopterus, Notopterus chitala, Tetradon cutcutia, Xenentodon cancila, Amphipnous Cuchia. As well as Exotic major carp of two species Cyprinus carpio and Ctenopharyngodon idella, Dominate in the catch. The Average catches composition of various groups of fishes (based on collection observation and interviewing of local wild fish collector, merchant /commission agent.

MATERIALAND METHODS

The entire study was undertaken mostly in morning hours. The samples were captured at intervals with the help of local skilled fishermen. Drag net, caste net, scoop net, basket trap, hooks etc. were used for capturing fish samples. The fishes collected from The Kusheshwar sthan chauras were treated with 8% formalin for 48 hours. After that the fishes were transferred in 5% formalin and preserved for further study in the laboratory of Department of Zoology, Millat college Darbhanga, L.N.M.U Darbhanga. Preserved specimens were identified to genus and species level using taxonomic keys and Standard literatures.

RESULTSAND DISCUSSION

During the entire study period, 50 species belonging to 18 families, 27 genera and 9 orders were collected and identified. The details of these fishes are listed in table-1 and figure 1- 50. The order Cypriniformes was observed as the most abundant including two families i.e. Cyprinidae (7 species) and Cobitidae (8 species). Among Cyprinidae Labeo rohita, Labeo calbasu, Puntius ticto, Puntius conchoni, Puntius Sarana, Esomus danricus, Chela laubuc, and Cirrihina mrigala, Cirrihina reba, Catla catla, Oxygaster bacaila, Amblypharyngodon mola, Botia Dario, Noemacheilus botia, Esomus danricus, leptocephalichthys guntea, Somileptes gangota representative of family Cobitidae as well as Sisoridae and, Schilbeidae family represents one species each family Bagarius bagarius and Silonia silondia. Siluriformes order represents 7 species order Channiformes represents 4 species order Mastacembeliformes represents 4 species, order Perciformes represents 7 species, order Clupeiformes represents 5 species, order Tetraodontiformes represents 1 species, order Beloniformes represents 1 species and order Symbranchiformes represents 1 species

CONCLUSION

The result of this study shows that Kusheshwar sthan chauras is very rich in fish diversity and sustains high productivity but due to lack of management as well as by the use of so many fish toxicants now fish production is declining if Kusheshwar asthan is used for cage culture fish production will increase so many folds. Scientific methods of fish culture and proper care are needed to upgrade this chaur. It will not only be profitable but also be an easier process to fulfil the protein requirement of malnutrition and unprivileged population of Kusheshwar sthan as well as Darbhanga district. Cage culture / Aquaculture have the potential to fulfil the nutritive food supply and can also enhance the food security and income generation of fishermen communities of this area.

ACKNOWLEDGEMENT

I would like to thank Dr. Soma rani Kolay, Reder and Head, Department of Zoology, Millat College Darbhanga, Dr. Mustak Ahmed, Principal of millat college, L.N.M.U. Darbhanga and Dr. T.T. Singh, JFRO Govt. Of Bihar for their valuable suggestions and encouragement through out the investigation.
